

Customer Loan Details Analysis

Navi is analyzing customer loan data to determine the performance and characteristics of their loan portfolio. They have collected data on customer names, loan amounts, interest rates, loan tenures, and approval statuses.

Your task is to perform various data extractions, calculations, and conditional analyses.

- **Customer Name:** Extract the customer's full name in **proper case**. For eg: Ramesh Kumar for the first row
- **Loan Amount:** Extract the loan amount as a number. For eg: 500000 for the first row
- **Interest rate:** Extract the interest rate as a number. For eg: 7.5 for the first row.
- **Loan Tenure:** Extract the loan tenure as a number. For eg: 10 for the first row.
- **Loan Amount Status:** Determine if the **Loan Amount** is above average.
 - If the value is **greater than** the **average** of Loan Amount, then it will be Above Average
 - Else if it is **less than or equal to** the **average** of Loan Amount, will be Below Average
- **Total Interest:** Calculate the total interest to be paid using the formula:
$$\text{Total Interest} = \frac{\text{Loan Amount} \times \text{Interest Rate} \times \text{Tenure}}{100}$$
- **Approval Status:** Extract if the loan is approved For eg: Approved for the first row.
- **Approved & Above Avg:** Calculate the average loan amount for approved loans (rounded off to two decimal places).
 - If **Approval Status** is Approved and **Loan Amount** is **greater** than average of the Loan Amount, then this value is Yes
 - Else it is No
- **Avg Loan (Approved) :** Calculates the **average loan amount** for Approved loans.
